RUD CONVEYOR SYSTEMS

FOR HORIZONTAL, VERTICAL AND INCLINED CONVEYORS

DO YOU EXPERIENCE ANY OF THESE CONVEYOR ISSUES

Is your chain equipment wearing out too quickly?
The new RUD chain grades offer optimal wear resistance.
More on page 10

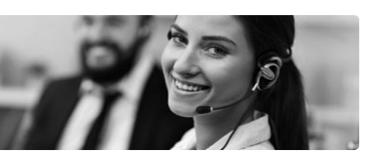

Are your chains or the teeth of the gears suddenly breaking? Is your system coming to a standstill due to this? How much is the damage if you have to shut down the system as a result of this?

The new chain grades offer up to 28 % improvement in breaking force. Your system will run safer and the risk of breaking will be minimised. **More on page 11**

Are you experiencing difficulties when installing components?

Then try our installation-friendly innovations such as Duomount or 2win. **More on page 26 und 42**

Are you missing an on-site contact person?
Then contact our nearest branch.
More at www.rud.com (units & locations)

Do you wish for more technical consultation and assistance?

Then simply ask us. directly contact our engineers and send us your challenges related to the conveyor system. **conveyor@rud. com** // **Technical questionnaires from page 64**

RUD SERVICE RANGE AND MILESTONES

RUD CONVEYOR TECHNOLOGY IN THE POWER STATION

1 Bunker discharge 2 Bridge scraper

3 De-asher

4 Chain conveyor

5 Components

Fossil power stations will also become an important contribution towards global supply of energy. For decades, RUD has been ensuring a high availability of coaling and ash remover plants with the help of its conveyor chains and hence ensures power generation in power stations. Thanks to our extensive experience in ash removal of large power plant boilers, biomass combustion as well as waste incineration and recycling, all our system components are always perfectly coordinated and always work reliably.

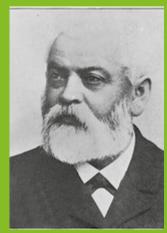

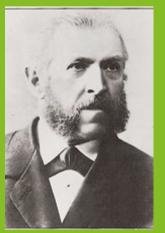

MILESTONES FOR CONVEYOR SYSTEM FOR BULK MATERIALS

TOGETHER FOR OVER 200 YEARS OF COMPETENCE

Whether it is a complete bucket conveyor, trough chain conveyor or spare parts for chain conveyors or maintenance and service, the RUD group is a reliable partner. Let it be transporting limestone from the mill to the bulk tank or conveying salts from the mine to the surface, our conveyor systems are robust and are optimally designed for these conditions. Thanks to our extensive experience in bulk conveyance of fertilisers, potassium & salt, cement and other special bulk materials, all our system components always work reliably.

- 1875 Foundation of RUD Ketten Rieger & Dietz Gmbh u. Co. KG
- 1906 As the first company, RUD introduces electric welding of chain links
- 1945 Foundation of business area of conveyor systems by Werner Riege
- 1961 Introduction of double-pitch case-hardened round link steel chains for high-capacity bucket elevator.
- 1965 Introduction of round link steel chain in 40cG material / market introduction of two-link bucket attachment
- 1985 Round link steel chain with RUD super 35 quality
- 1992 RUD apron conveyor
- 1994 RUD central chain installed in high-capacity bucket elevator
- 2001 Market introduction of RUD SWA side-wallattachmen
- 2004 Integration of H & E in RUD grou
- 2006 Market introduction of RIID 2win two-link bucket attachmen
- 2007 RUD forked link chain FORKY
- 2008 Central chain bucket elevator for 800 t / h
- 2009 First trough chain conveyor with RUD forked link chain FORK
- 2011 1St tanuem central chain bucket elevator for 1500 t
- 2011 Introduction of brand name BULKOS
- 2015 Conveyor chain R160
- 2017 Market introduction RUD RUCa single-link attachment short assembly and disassembly times, without special tools

MILESTONE OF H + E HERFURTH & ENGELKE CONVEYOR SYSTEM TECHNOLOGY Braunschweig / Germany

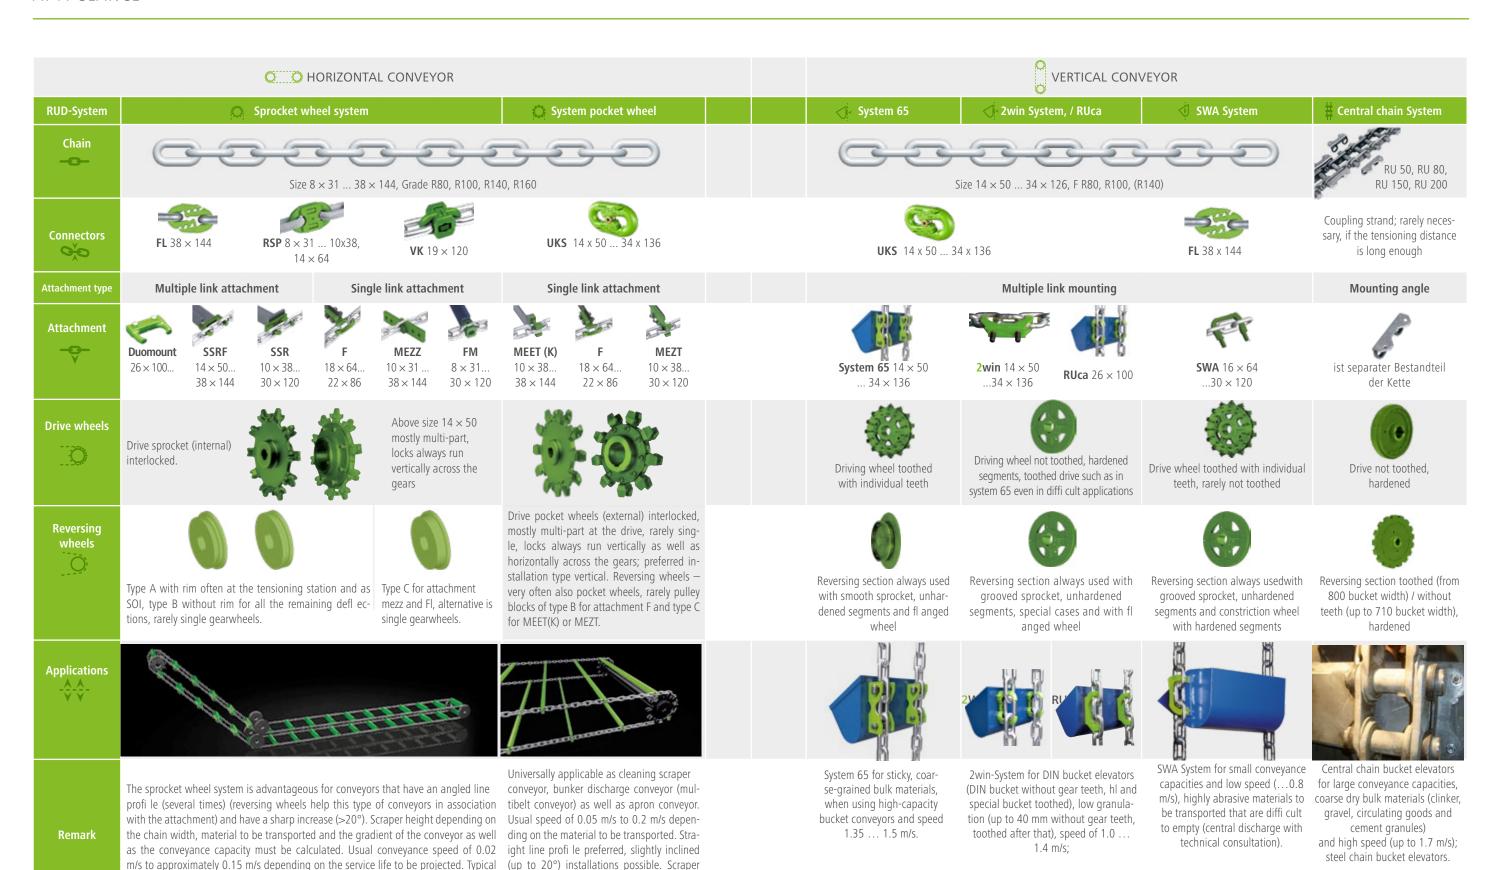

- 1932 Foundation of engineering office fo conveyor systems
- 1933 Creation of 1st continuous flow conveyor for bulk materials
- 1940 Beginning of own production of 1st chain bucket elevator, 1st screw conveyor, 1st apron conveyor
- 945 Foundation of machine factory Herfurth & Engelke
- 1960 1st belt bucket elevato
- 1969 1st chain bucket elevator for 300 t / h
- 1970 1st trough chain conveyor for 600 t / h
- 1072 Transport of 1000 + / b /band conveyor
- 1073 1st scrow convoyor for 300 t / h
- 1981 1st vertical screw conveyo
- 1985 Development of high-capacity bucket elevator, 1st usage of steel cord belt in
- 1988 Development of parallel weight tensioning station for bucket elevators, transport of 3000 t / h (band conveyor)
- 998 1st central chain bucket elevator,
- 2001 1st central chain bucket elevator

RUD CHAIN TECHNOLOGY

SPECIAL PRODUCTS — WHAT HAS IMPROVED IN OUR NEW CHAIN GRADES?

This results in: Accurate link geometry · Highly calibrated links Customer benefi t: · Optimised running geometry with components and wheels · Better interlink contact to extend chain life

2 100 % FULLY AUTOMATIC WELDING CONTROLLER WITH PRECISE LINK

This results in: Optimal process control Customer benefi t: Longer life · Increased breaking force · Safer operation

RUD is benchmark company in providing quality products with advantages in wear resistance and performance ahead of all competing companies

3 100 % FULLY AUTOMATIC CONTROL AND REGULATION OF CALIBRATION

This results in: Highly calibrated chain strands · More accurate chain properties for multi-strand applications Customer benefit: Optimised run-in behaviour · Lower wear · Lower maintenance costs

100% WORLD FIRST! RUD CONVEYOR CHAIN R160 MADE OF SPECIALLY SMELTED SPECIAL STEEL

This results in: New options in heat treatment Customer benefi t: Improved wear characteristics in case of equal breaking force

RUD ROUND LINK STEEL CHAINS

RUD SPECIFICATIONS, HARDNESS CURVES

RUD ROUND STEEL CHAIN R160

TOUGH AND 30% MORE RUNNING TIME

HARDNESS PROFILE ACROSS THE CROSS-SECTION **CROSS-SECTION CHAIN CROSS-SECTION CHAIN** Cross Section R140 Cross Section R80 R140

RUD offers its customers nothing less than double the service life in the use of bucket elevators and ash removal systems - the new round steel chain R160 has been optimised with regard to a longer service life.

Our special chain steel improves the wear behavior significantly without any loss of breaking force. Its breaking stress of up to 400 N/mm² provides especially for particulary rough and heavy duty operating conditions (e.g. in coal fired powerplants) a better performance in relation to other chain grades and the refore an increase of the revision time frame up to two times. The opreating time of the whole facility will be singificantly increased.

The R160 is currently available in the following sizes: \cdot 22 x 86 mm \cdot 34 x 136 mm

· 26 x 100 mm · 38 x 144 mm

· 30 x 120 mm

The RUD R160 offers improved technical features that contribute to higher economic efficiency and operational safety. In combination with other products in the portfolio, RUD offers its customers the most innovative tailor-made solutions.

MORE THAN YOU EXPECT - FULL OPERATION IN ROUGH CONDITIONS

RUD stands for innovation and quality. With the R160, RUD's think tank launched a product on the market that can clearly extend the service life of our bucket elevator. The R160 acquisition costs were certainly higher, but considering the TCO (Total Cost of

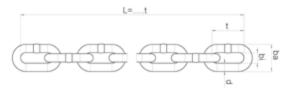

Ownership), the investment has definitely been worth it. All plant owners will certainly be keen to increase their production capacity levels while reducing costs at the same time. This goal can indeed be achieved with the R160."

> Robert Ott Head of Maintenance

RUD CHAIN CONNECTORS

UKS // CONNECTING LINK

RUD CHAIN CONNECTORS

RSP // VK // FL

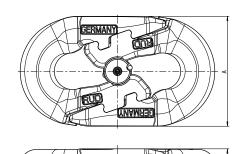

UNIVERSAL CHAIN CONNECTOR UKS

Advantages of the UKS chain lock

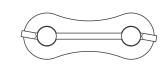

- Quick and easy installation by one person
- Case hardening corresponds to the qualities R80-R160
- Fits RUD pocket and chain wheels
- Improved design of the teeth to prevent breakage
- It is no longer necessary to observe a tightening torque
- One connector for all transport tasks with round steel chains/link chains in conveyor technology. This means less stockholding & fewer order numbers in purchasing
- Easier and faster installation. This means less downtime for installation and repair of all types of conveyors
- No binding installation direction, as the UKS universal chain lock runs over pocket and chain wheels
- Reduces your total cost of ownership

B RUD

TYP A // TYP B // TYP C

TOOTHED SEGMENTS WITH INCREASED PITCH CIRCLE DIAMETER

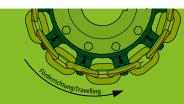

Tooth discs and individual teeth, optimally adapted to the proportional chain extension given at the time of replacement. Available in dimensions 14×50 to 38×144 for all multi-part sprocket wheels. Prices on request!

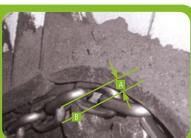

PREVIOUS - CHAIN RUNS AGROUND!

- Flank clearance used up

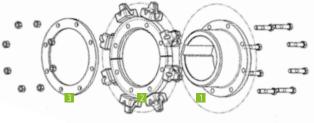

The chain suited enlarged p.c.d. of the teeth

LATER -THE CHAIN WEAR IS COMPENSATED FOR BY USING A NEW TOOTH SEGMENT WITH LARGER TOOTH FLANK.

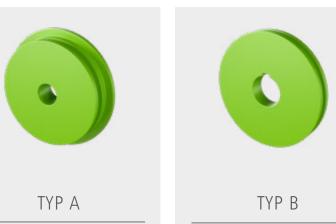

STRUCTURE OF SPROCKET WHEEL - MULTI-PART

IN CASE OF NEW CHAINS, NEW TOOTH DISCS / INDIVIDUAL CHAINS SHOULD ALWAYS BE USED.

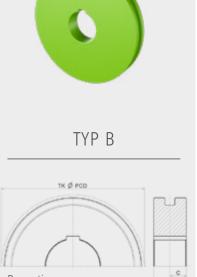

- 1. Hub disc
- 2. Tooth wheel segment
- 3. Counter disc

In case of new chain components, the horizontal link is on the horizontal link support of the tooth when running-in on the fi rst tooth of the sprocket wheel. Chain elongation due to wear results in the chain mounting in the direction of the tooth tip. In this case, the vertical link is only taken from the tooth tip and there exists the danger of skipping the chain.

- · Grooved wheels with rim
- · For using at tensioning stations

- Properties:
- Grooved wheels without rim
- For using in loose side of the belt under the trough

TYP C
Properties: Plain wheels with rim For both the use cases, however only possible when using fl ange attachments and very short scraper distances

RUD ATTACHMENT SYSTEM SPROCKET WHEEL

ATTACHMENT FM

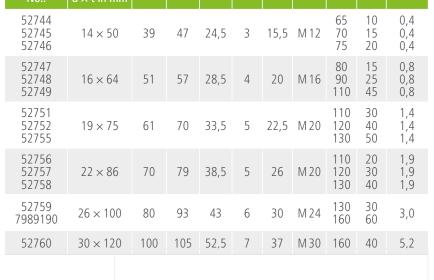

Properties:

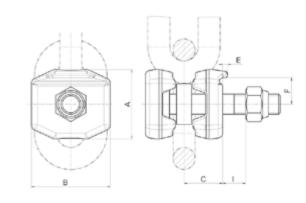

- · Screwed and can be clamped / screwed in the tensioned chain strand
- · For scraper height up to 1.8 times the outer
- chain link width
- · Variable scraper distance possible
- · For rough operating conditions
- \cdot Run over sprocket wheels and plain wheels

H = screw length I = clamp length

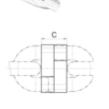

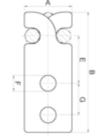

MITNEHMER MEZ-Z

- · For medium to diffi cult operating conditions
- For scraper height up to 1.5 times the outer chain link width
- · Assembly and disassembly in case of tensioned chain possible
- · Run across sprocket wheels and fl at wheels

ATTACHMENT FM, MEZ-Z & F // 25

DUOMOUNT // SSR SSRF

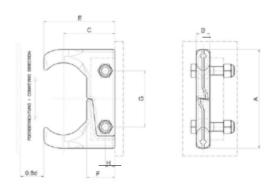

ATTACHMENT **DUOMOUNT***

Properties:

- · For very high conveyance capacities up to 50 t/h
- · For scraper height up to 2.5 times the outer chain link width · Scraper profi les of any shapes possible
- · Highly wear-resistant

- · Multiple link attachment
- · Can be tensioned in the tensioned chain belt
- · Variable scraper distance possible
- · Runs over sprocket wheels and grooved wheels

RUD SCRAPER BARS

SAFER SCRAPER OPERATION WITH MATCHED RUD STRANDS

RUD PRODUCT ADVANTAGE: LABELLING OF SUITABLE PAIR USING COLOURS!

OUR SCRAPER BARS AND ATTACHMENTS FORM THE PERFECT SYSTEM IN ASSOCIATION WITH OUR PAIRED CHAIN STRANDS:

- · Simplest assembly and disassembly
- · Optimal run across the pocket and sprocket wheels
- · The suitable scraper design for every material to be transported
- · Lower wear
- · No scraper tilting
- · Everything from a single source Chains, connectors, scraper bars and wheels

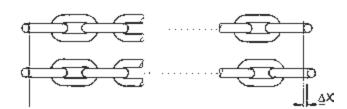

Strand lengths, production tolerance:

+ 0 4 %

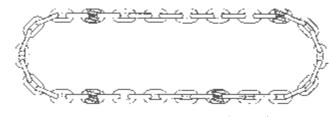

-0.15% = 0.55% max.

i.e. for 10 m length, max. difference 55 mm

length tolerance $\Delta \mathbf{X}$ of matched chain left (Multiple-belt-conveyor) $\Delta \mathbf{X} = 0.05$ % max., i. e. for e. g. 10 m long belts the max. difference is. 5.0 mm. if the length of the belt is < 8 m, the largest pair tolerance = 4 mm.

Strand series

When ordering chain loops in millimetres, we require the precise scraper distance for distributing into individual chain strand lengths.

RUD SCRAPER BARS

THE CORRECT SCRAPER BAR FOR YOUR REQUIREMENTS

RUD scraper bars are always optimally adapted to the requirements and operating conditions specified to us by the customer. We produce scraper bars as per the specifications of the customers, provided that no consultation or support is necessary. Alternatively, we suggest an optimal scraper version based on an intensive consultation, which is developed in the dialogue.

The following information is hence necessary and evaluated by us:

- · Clear trough width of the conveyor as well as its exact line profile
- · Trough bottom material and design
- · Chain centre distance

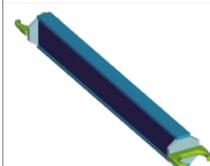

USAGE EXAMPLES* — SCRAPER BARS AND ATTACHMENTS

Standard U profi le with MEE-T attachment

Typical usage options: Cleaning scraper conveyor

Standard scraper bar design for diffi cult conditions with SSRF or DUOMOUNT

Typical usage options: Wet de-ashing systems

Standard angle profi le with MEE-T attachment

Typical usage options:
Coaling systems / coal feeders
Bunker discharge conveyor

* Other scraper designs on request; if necessary, use the sketch on page 67

RUD SYSTEM POCKET WHEEL

ATTACHMENT MEE-T

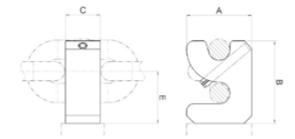

ATTACHMENT MEZ-T

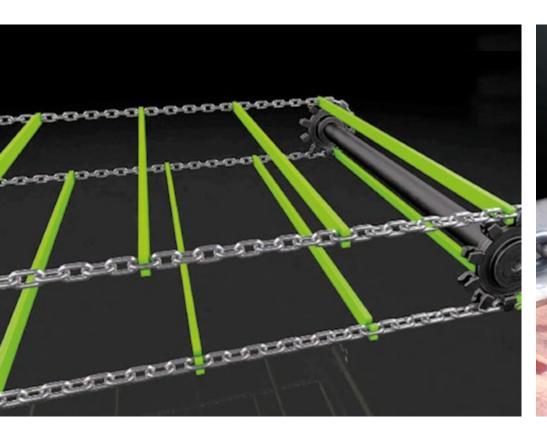

MEE-T IN ONE PART FOR SYSTEM POCKET WHEEL

Properties:

- · For diffi cult operating conditions
- · Scraper height up to 1.5 times the chain link width
- · Double-strand conveyor and multiple- strand conveyor systems
- · Can be welded to anything
- · Securing with locking pin if necessary
- · Run over pocket wheels and plain wheels
- · Deliverable with and without pin locking

RUD BUCKET ATTACHMENT SYSTEMS

AT A GLANCE

Problems of the DIN-Systems

· Chain bracket has a double function

- · Transmission of tension of the chain loop
- · Fixing the bucket to the chain loop and absorbing bucket strain
- · Weak point double-function may lead to fatigue fractures
- · Additional consequences may be loose screw fi ttings
- · Even over-dimensioning in heavy conveyor operations does not solve these problems

Solution RUD multi-link-fastenings 2win and System 69

- · Assembly over several chain links
- · No transmission of tension from the chain to the attachment
- · Gentle introduction of the scooping force into the chain strand
- · Minimizing wear in the chain joints

				Solve these problems		William Zing Wear in the chain join

RUD CHAIN ELEVATORS

AT A GLANCE

RUca t chains, traction

Highly wear-resistant chains, traction wheels or sprockets ensure that even abrasive materials are transported reliably. Specially designed chaintype bucket elevators

are available in either centrifugal / gravity, positive or central discharge designs dependent on the application

Not permitted for snub roller $\ensuremath{\mathtt{8}}$ mid-discharge bucket elevators.

The bucket elevator casings are selfsupporting, but they require horizontal guides at least every 15 meters and below the elevator head. The bucket elevator head comprises a lower section with doors to access the adjustable discharge plate, and braced bearing mountings, for the pedestal bearings which support the drive shaft, the shaft exit points use grease fi lled radial shaft seals. The upper sections comprise a multipart removable hood with an inspection door. A drive platform is mounted on the side of the lower part of the head for supporting a wide variety of commercially available drives. If required a maintenance platform and or an overhead support/ service beam can be fi tted if required. An elevator drive normally consists of a geared motor unit, which is normally connected to a frequency controller for maintenance purposes. For higher power requirements, we recommend a drive unit with a bevel spur gearbox, and standard motor optionally with ancillary drive. Starting characteristics can be optimized by a hydraulic clutch or an electric soft start.

The double or single leg casing is torsionally rigid sheet metal housing, constructed of standard section lengths with fl ange connectors. The maintenance and assembly door position should preferably be located in the elevators raising casing leg, approximately 0.8 m above a platform.

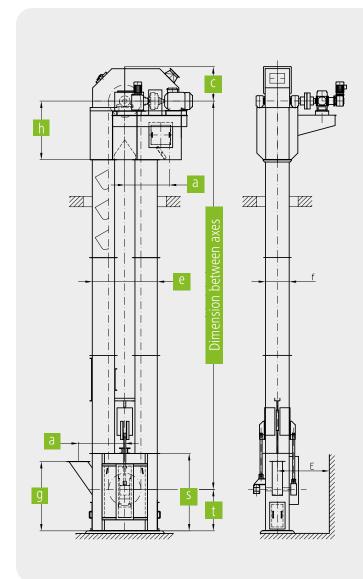

The elevator boot is optionally designed with either internal, oil-fi lled bearings or external pedestal bearings. With external bearings, the shaft exit points are sealed by gray cast-iron stuffing boxes. There are large assembly doors and cleaning doors on both sides. The chain takeup tension is generated by a weight or spring-loaded spindle take-up device.

Depending on the type of chain used, RUD driving wheels are either non-toothed chain pulleys with replaceable, highly wear-resistant segments, or toothed sprocket wheels with replaceable, highly wear-resistant teeth. The RUD return wheels have replaceable, highly wear-resistant segments which in certain designs incorporate guide discs.

Buckets are manufactured according to DIN or our works standard. The materials used are steel, stainless steel, or rubber.

Buckets are attached by chain shakkles, bolted clamping clips, plug-in attachments or angle brackets.

The chains are either hardened, round link chains to DIN Standard or works standard chain designs made of special, highly wear-resistant alloy steel. Engineering style chains are also used, as either double or single central chains.

Standard safety devices such as speed governors and level indicators, to monitor the operating status of the bucket elevator are incorporated. Additional accessories are available.

RUca – The RUD alternative to DIN system

RUca only available as a system in conjunction with RUD chains and RUD chain connectors.

MOUNTING SEQUENCE

BUCKET REAR MOUNTING RUca

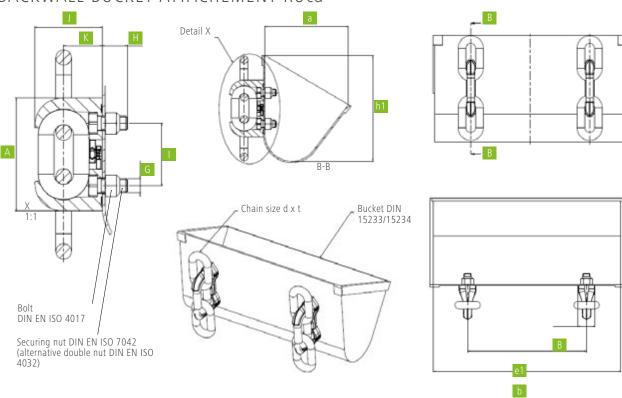

Properties:

- \cdot RUD endless chain strands must be used
- · Short assembly and disassembly Butimes, without special tools
- · Travel over plain wheels
- · Higher component break resistance
- · Suitable for replacing all the DIN bucket attachments in round steel link chain bucket elevators exept side-wall attachments
- · Less wear and tear on chain
- · No oversized components

RUD CHAIN WHEEL

FOR BUCKET ELEVATORS 2WIN, RUCA, SWA

Eigenschaften:

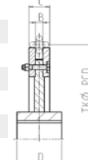

- · Especially suitable for RUD systems 2win and sWa
- · Finish-drilled and grooved as per customer requirement
- · Robust welded construction with replaceable bearing
- · Hardened bearing ring segments for the drive
- · Unhardened bearing ring segments for defl ection

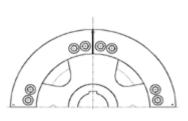

Special grooved wheels and guide wheels on request.

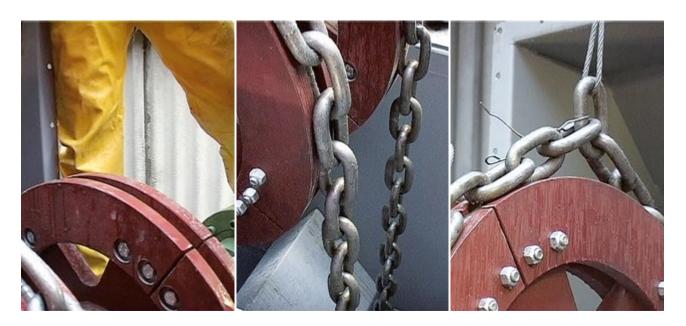

Spare parts: Per chain roller a set of segments

RUD CENTRAL CHAINS

RU50 // RU80 // RU150 // RU200

Components of central chain

The central chain consists of four basic elements, inner plates, bolts, outer plates and bu-

cket attachments.

The chain can be easily opened, shortened or extended by simply bending the chain links at every position without the tool in an assembly-and disassemblyfriendly way.

A favourable force distribution and tolerance compensation is achieved using the bolt bearing at the outer plate, which is also carried out in the bushings.

in the bushings.

The buckets are mounted using bilaterally stable bucket attachments, which are pushed to the bushings of the outer plates. Increase in the useful life in case of wear of the chain can be achieved once again by turning over the chain.

Properties*:

- · Hinge points: Bolts fl oat-mounted high wear volume
- · Assembly: without special tool possible · Standard strand length: 1080 mm packaged in an assembly-friendly way

The bucket elevator casings are selfsupporting, but they require horizontal guides at least every 15 meters and below the elevator head. The bucket elevator head comprises a lower section with doors to access the adjustable discharge plate, and braced bearing mountings, for the pedestal bearings which support the drive shaft, the shaft exit points use grease fi lled radial shaft seals. The upper sections comprise a multipart removable hood with an inspection door. A drive platform is mounted on the side of the lower part of the head for supporting a wide variety of commercially available drives. If reguired a maintenance platform and or an overhead support / service beam can be fi tted if required. An elevator drive normally consists of a geared motor unit, which is normally connected to a frequency controller for maintenance purposes.

For higher power requirements, we recommend a drive unit with a bevel spur gearbox, and standard motor optionally with ancillary drive. Starting characteristics can be optimized by a hydraulic clutch or an electric soft start.

The double or single leg casing is a torsionally rigid, sheet metal housing constructed of standard section lengths with fl ange connectors. the maintenance and assembly door position should preferably be located in the elevators raising casing leg, approximately 0.8 m above a platform.

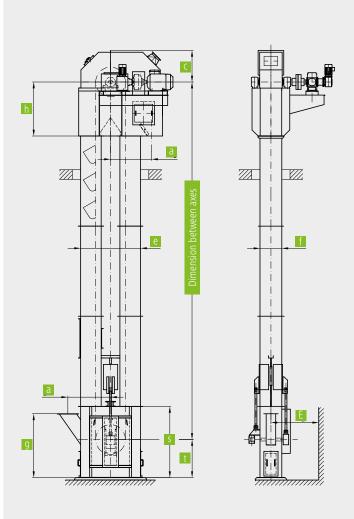

The elevator boot is optionally designed with either internal, oil-fi lled bearings or external pedestal bearings. With external bearings, the shaft exit points are sealed by gray cast-iron stuffing boxes. There are large assembly doors and cleaning doors on both sides. The belt take-up tension is generated by a parallel weight or spindle take-up device.

Whereas the parallel weight take-up automatically compensates for belt stretch, the spindle take-up requires manual readjustment. The driving pulley has a structured rubber covering. Easy to replace, bolton, dished rubberized segments are available upon request.

The take-up pulley is designed as a cage drum. internal conesquide any material that enters the drum out to the sides.

The buckets are manufactured according to din or our works standard. The materials used are steel, stainless steel, aluminum, plastic or rubber. The bucket attachments are selected according to the loads to be handled. Rubber strips are fitted between the belt and the backs of the bukkets. The buckets are attached by means of belting bolts, spherical or halfround segments with countersunk bolts. The belts are available with textile or wire-cable reinforcement. Additional accessories are available brackets or claw connectors. Hot-material rubber compounds are used for transporting high-temperature materials. The belt is jointed by mechanical connecting brackets or claw connectors. Belts with a low linear expansion can be continuously vulcanized.

Standard safety devices, comprising off-track governors, speed governors and level indicators, to monitor the operating status of the bucket elevator are incorporated.

Belts with a low linear expansion can be continuously vulcanized.

THE RUD DRIVE DRUM DESIGN, WITH A CYLINDRICAL CENTRAL SECTION AND LATERALLY DECREASING DIAMETER, ENSURES

- · Uniform load distribution across the width of the belt
- · Low wear on the friction lining
- · Stable running of the belt and so
- · A longer service life for the bett

THE RUD DRIVE DRUM DESIGN WITH INTERCHANGEABLE FRICTION LINING:

- · The friction lining is easily exchangeable when worn
- · It can be exchanged without removing the drum or opening the belt
- · This makes it easier to maintain and so
- · Reduces down times
- · The segments can be re-used after replacing the rubber

THE RUD PARALLEL TENSION UNIT ENSURES:

- · Automatic extension compensation of the belt
- · A low pretension force and so low loading
- · Stable running of the belt
- · A maintenance-free design

RUD STEEL-CABLE BELTS HAVE:

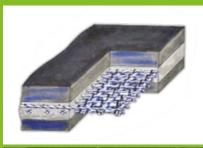

- A tensile strength of 800-3150 n / mm belt width and a low linear elongation of maximally 0.3 %. This means that the bel never needs shortening during its entire service life.
- Steel cross-bracing on both sides to give high transverse rigidity, and so optimal straight running and high tear out strength of the burkets
- Hot material rubber compositions for conveying material at a continuous temperature of up to 130 °C, and temperatureresistance up to a maximum 10° C peak load.
- 5 mm thick cover plates on both sides and solid rubber edge protection for a long service life, even when handling highly abrasive materials.
- Bucket attachment holes cut by water jet to ensure the highest quality.
- · Belt ends prepared in the works for endless connection with mechanical belt connectors. Endless closure can also be achived by hot vulcanization.

RUD BUCKET ATTACHMENTS:

- Have soft rubber inserts between the backwalls of the buckets and the belt, which prevent the material jamming and reduce the effects of heat on the belt.
- · Can optimal adapt to the convexity of the drums.
- · Have always the optimal fastening element for the particular
- · Have extremely high tear-off strength when used with steelrope belts, even in the coarse grain range.

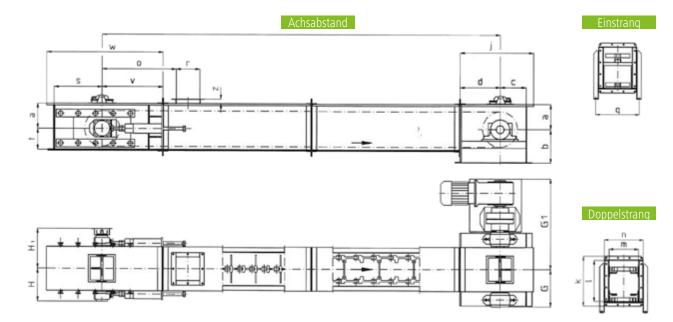

RUD TROUGH CHAIN CONVEYOR

Trough chain conveyors are especially suitable for the dust-free, horizontal and moderately inclined transport and metering of bulk materials, including coarser type material. Trough chain conveyors combine high wear and heat resistance with the option of multiple inlets and outlets. We also supply a special version with cleaning scrapers.

vent overloads.

The trough consists of individual, standard-length sections with connecting fl anges. Hold-down rails are recommended or most of the materials to be conveyed. These prevent the material from building up and thus the chain climbing. For moderately abrasive materials, the side walls and base plate are protected by manganese alloy steel against wear. Fusion-cast basalt linings or liner plates with hard surface welding are recommended for use with highly abrasive materials. In special cases, the trough floor can be designed to act as a material pad.

The take-up station has fl ange

are equipped with grease filled, double radial shaft seals. The entire station together with the inspection door can be dismounted for easy maintenance. The chain take-up is generated and set by spring-loaded pressure

The driving and return sprockets are highly wear-resistant and have interchangeable, hardened toothed segments.

The standard conveyor chains used are forged, fork-sprocket chains that have been heat-treated or case-hardened.

The resistance to wear can be further increased by hard surface welding. Available options are: highly wearresistant RUD round steel chains, bushed transporting chains according to DIN 8165 and block chains.

Standard safety devices, comprising speed governors and take-up screw monitors, detect the operating status of the trough chain conveyor.

Additional accessories are available.

* All the attachment types can also be delivered with welded plates as per your specifi cation! All types on

Forked-link chains are suitable for transporting powdered, fl aky, grainy and fragmentary bulk materials, but not for sticky or baking bulk materials.

Properties:

· Multi-part design

Flour, cement, grains, sugar, chemicals, chipped wood, chips, foodstuff, animal feed etc.

Advantages:

- · Simple and robust construction, high operational sa-
- · Lower space requirement
- Horizontal, inclined and vertical conveyor possible
- · Explosion safety through slow conveyance without recirculating the material

Disadvantages:

- · Limitation of use regarding suitable conveyance materials
- · No chunky, fi brous or sticky bulk materials

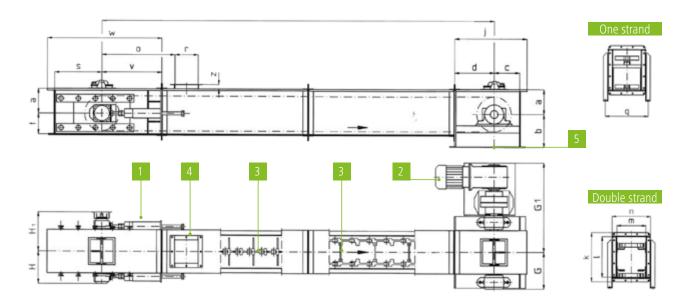

^{*} Theoretical value for case-hardened forked-link chains

RUD TROUGH CHAIN CONVEYOR

Coal, chips, soda	0,50
Cement, phospate, gypsum	0,25
Clinker, petrol coke, potash	0,20
Filter dust, pyrite	0,10
Ash, coke, sand, quartz	0,05

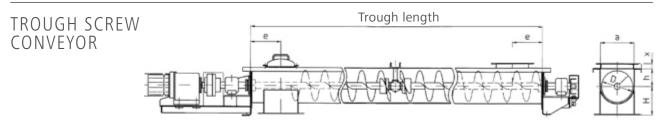

RUD SCREW CONVEYOR

B RUD

TROUGH SCREW CONVEYOR // TUBULAR SCREW CONVEYOR

Long-lasting, easy to maintain screw conveyors are used for the dust-free, horizontal, inclined and vertical transport of fi negrained and fl oury materials. Suitable adaptations are made to handle coarse-grained, higher temperature, abrasive or poorly flowing materials. Screw conveyors also offer the option of multiple inlets and outlets. Various versions handle not only the transport of bulk materials but also emptying, metering, loading, screening and mixing.

The conveyor trough in trough screw conveyors is manufactured as a torsionally rigid sheet metal housing made of standard section lengths with connecting fl anges, to which are bolted sturdy cover plates, there is also an inspection door above the outlet. Abrasive materials can a standard geared motor unit. be handled by using manganese alloy steel, hard surface welding, fusioncast basalt linings or material padding. Split end walls are bolted to As a safety device, a speed goverthe ends of the trough. This makes it easy to dismount the screw shaft nor detectsthe operational status once the metal cover plates have been removed.

The conveyor trough in tubular screw conveyors consists of a stable Additional accessories are availatube with an inspection door above the outlet. One-piece end walls are bolted to the ends of the trough. These are suitable for supporting the conveyor. Intermediate supports are only required about every 6 meters. They are supplied loose for mounting during assembly. The shaft exit points are usually sealed by gray cast iron stuffing boxes.

The screw shaft is designed as a solid shaft or a rigid tubular shaft with integrated endjournals and a welded-on screw thread. The end bea-

rings are pedestal bearings with antifriction- bearing inserts. When a screw shaft requires intermediate bearings for longer conveying distances. These are designed as easily replaceable units, the torque is transmitted by bolted couplings.

We supply a plain bearing as standard with replaceable twopart, gray cast iron bearing shells. They can be set up for grease gun or central lubrication according to the operational conditions. On request, we also supply antifriction bearings with split roller bearings in a sealed, grease-filled suspended housing. The drive comprises

of the screw conveyor.

GENERAL INSTRUCTIONS

INSTALLATION AND OPERATION

The adjustability of the defl ection should at leastbe 3 link divisions (compensation of the setting process when running the chain or when chain abrasion takes place).

The usable tensioning distance should be determined after taking into account the length of the loop and the aggressive strain, which affects the chain. Securing the round link steel chains against excess strain or getting blocked by coarse or foreign bodies by means of suitable safety coupling, shear pin or on the drive.

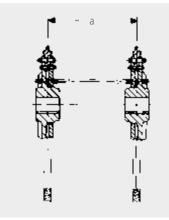

When assembling the sprocket wheels or pulley blocks as well as when manufacturing buckets / bucket attachment and when attaching insertion rails at the return station, accurate adherence to installation dimension and tolerances specified in the respective installation drawings is the prerequisite of proper functioning.

Adhere to the constant initial tension using springs or weights in adjustable tensioning devices, where the size of the chain pretensioning force must be coordinated as per the specifi cations of the respective conveyor. During their complete service life, the chains must be under the correct initial tension. Loose chains give rise to difficulties.

During all the system constructions, the corresponding accident prevention regulations must be considered.

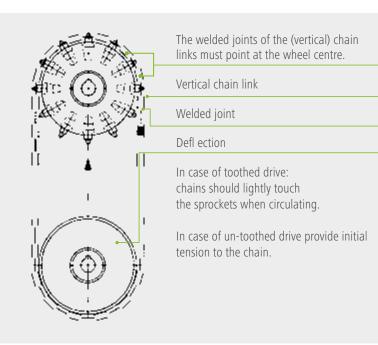

The bulk material to be transported must be supplied in such a way that equal distribution is ensured across the width of the buckets / scraper bar width and all the chain loops are equally tensioned through the bulk material and the tractive force. In case of lateral feed, corresponding precautions must be taken.

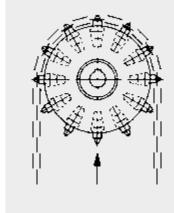

Unequal loop stress leads to unequal increase in division due to the wear of individual chain loops; this results in the slanting of the buckets / scraper bars, which in turn results to faults at the return station.

Leave distance "a" by means of 2 limiting screws during assembly! (corresponding bores at the wheels available, no RUD delivery for limiting screws).

Wheels that are grooved pair-wise and marked using colours must be put on a shaft together.

In case of replacements: here, replace individual teeth without taking off the chain.

When replacing the chains (setting up a replacement), the chain locks and the individual teeth must also be replaced.

The wear state of the chains is reached in case of permissible increase in division due to wear of about 3.5 %.

After an abrasion of 1.5 %... 2.0 %, teeth should be used with increased link support.

MAINTENANCE & MONITORING

ASSEMBLY INSTRUCTIONS FOR CONVEYOR SYSTEMS IN THE RUD SYSTEM

RUD conveyor chains – highly wear-resistant– are hard-wearing due to their simple structure assembly and hence require very little maintenance. The following points must be observed with regard to high operational safety:

Lubrication: RUD conveyor chains — highly wear-resistant — do not normally require lubrication. Such chains may however be lubricated with standard engine oil (not grease), which do not come in contact with the bulk material or aggressive dusts etc. and hence formation of lubrication gel paste in the joints cannot be safely ruled out. Dirty chains should be cleaned before re-lubrication.

Initial tension: The chain tensioning must be checked periodically, especially during the start-up phase of new chains and / or in case of large loop lengths. It must be tensioned only to the extent necessary for the proper functioning of the chain and carriers during normal operating conditions. In case of multi-belt conveyors, the initial tensioning force of all the chain loops must be equal. Unnecessary high initial tensioning force reduces the service life.

Monitoring: Chains, locks, wheels, sprockets and fl ange parts must be checked at periodic intervals for damages, corrosion and unusual wearing parts, and the conveyor elements for defl ection and the like. While doing so, attention must be paid to the state of the wearing and safety parts. Damages detected must be immediately rectified.

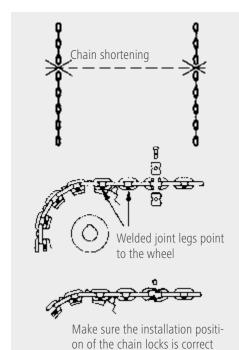

Wear: Round link steel chains and wheel gearing wear out together up to the wear state under normal conditions. This is reached if the chain links at the driving gear run jerkily under normal conditions. This is feached if the chain links at the driving geal full jetking under stress due to the abrasion to the chain and simultaneous normal chain tensioning or come off suddenly, i.e. are coves off over the normal break-off point. If the distances between the axis is large, the bulk material is heavily worn out or corroded, in case of high speed, heat infl uence etc., the chain can run jerkily at the driving gear although the measured increased division due to abrasion is still less than approximately 1.5 %. In this stress and control of the chain and simultaneous normal chain tensioning in M 36 and M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 and M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 are considered in the chain and simultaneous normal chain tensioning in M 36 are considered in the chain and simultaneous normal chain tensioning in the chain and simultaneous normal chain tension in the chain and simultaneous normal chain tension in the case, the wheel gearing is worn out due to the especially high stress and only this must be replaced - but simultaneously at all the driving gears. In principle, the new round link steel chains must only be used along with the new wheel gearing. Round link steel chains, whose average link thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by more than 10 % of the nominal thickness at any location has reduced by the new more than 10 % of the nominal thickness at any location has reduced by the minal thickness, must be removed. (average link thickness = mean of 2 dimensions taken perpendicular to each other at the maximum weakened cross-section).

In case of necessary chain reductions, level links must be cut out at the belts to be shortened. Shorten chain belts to odd number of links only, in order to get level starting and fi nal links. The chain links must be carefully cut using cutting discs and without damaging the neighbouring links. Avoid heat infl uences on links not affected by the cutting at all costs.

Welding works: In principle, welding processes should not be carried out at the round link steel chains, chain locks or deeply case-hardened components. It is not permissible to use the chain as earthing connection for electro-welding work at the steel construction.

In case of single and multi-belt conveyors: The welded joints of the chain links at the level of the gear must point at the driving gear; the position of the other links is arbitrary. Make sure that the installation position of the chain locks for the sprocket wheels is correct — coach bolt parallel to the sprocket wheel axis (also applicable for pocket wheels and striation sprockets). Install carefully and tighten the screws (strength class 8.8) using torque spanners. After a specific period, re-tighten the screws once again. Assembly for Fa fl at lock: link U brackets, hammer in locking bolts and secure with a locking pin

RUD Conveyor & Drives

RUD TECDOS mechanical engineering

Cool moves for heavy tools and bulky items: With the RUD TECDOS TM TOOL MOVER, the RUD TECDOS TMB workbench with turnover device and the RUD TECDOS TS TOOL SEPARATOR, handling tools has never been so safe, e cient and effective in terms of costs or processing.

RUD conveyor technology

Combinable components & individual parts for conveyor technology, conveyor systems and mining. RUD offers you perfectly coordinated systems and components for horizontal, vertical and ascending conveyors.

RUD TECDOS drive technology

The RUD TECDOS team develops and produces drive solutions for rotating, lifting, moving or telescoping. In addition to the components range, TECDOS OMEGA and PI-GAMMA drives are also available as complete system drives.

RUD industrial chains

RUD components are the first choice worldwide for leading hoisting equipment manufacturers. We also offer a wide range of round link chains for different industries and areas, such as food, fishing and awnings.
